

Create authentication service that returns JWT

As part of first step of JWT process, the user credentials needs to be sent to authentication service request that generates and returns the JWT.

Ideally when the below curl command is executed that calls the new authentication service, the token should be responded. Kindly note that the credentials are passed using -u option.

Request

```
curl -s -u user:pwd http://localhost:8090/authenticate
```

Response

```
{"token":"eyJhbGciOiJIUzI1NiJ9.eyJzdWIiOiJ1c2VyaWwWF0ljoXNTcwMzc5NDc0LCJleHAiOiE1NzAzODAzR9.t3LRvLCV-hwKfoqZYlaVQqEUiBloWcWn0ft3tgv0dL0"}
```

This can be incorporated as three major steps:

- **Create authentication controller and configure it in SecurityConfig**
- **Read Authorization header and decode the username and password**
- **Generate token based on the user retrieved in the previous step**

Let incorporate the above as separate hands on exercises.

Aim

To create an authentication REST service that validates user credentials and returns a JSON Web Token (JWT).

Tools Used

- Spring Boot
- Spring Security
- JJWT Library
- Maven
- IntelliJ IDEA

Steps Performed

1. Added Spring Security and JWT dependencies.

2. Configured users using SecurityConfig.
3. Created AuthenticationController.
4. Read username from the Authorization header.
5. Generated JWT using the JJWT library.
6. Returned the JWT in JSON format.
7. Tested using the curl command.
